# HAVER Reel Changer

## Enhanced economic efficiency through reduced downtimes

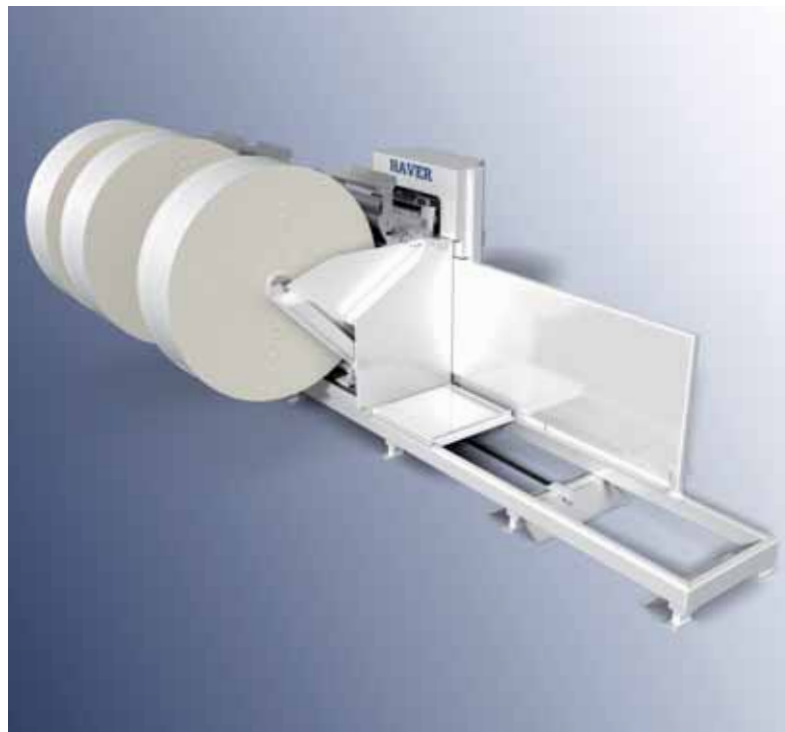

Reel Changer – two-fold reel changer

### Success factor: time

With the automatic reel changer your FFS plant is supplemented by a component which substantially enhances its productivity. Downtimes are minimised so that the performance can be increased by up to 10%. At the same time the operator is given additional space for inserting the film reels. By utilising proven elements of the HAVER FFS technology, the film ends are sealed ensuring that the actual filling operation is only marginally interrupted. In the operating process the transition area from the old to the new reel is removed and discarded into the waste position without the operator intervening. Existing machines can be retrofitted with the reel changer. The reel changer may optionally be equipped with a lifting device for the film reels.

**HAVER FFS Systems are always the right choice to achieve the highest production rate.**

Reel Changer – three-fold reel changer
